SweatBet Pitch Deck

▼ Pitch Deck Outline For Sweat Bet

Slide 1: Offering

- **Headline**: "Sweat Bet: Motivating Fitness Through Competitive Betting"
- **One-liner**: "An app that lets you bet on your fitness goals, using real money stakes to boost commitment and exercise consistency."

Slide 2: Problem Statement

- **Key Pain-Points**:
  1. Lack of motivation for regular exercise.
  2. Difficulty in maintaining fitness routines without accountability.
  3. Limited community support for personal fitness goals.

Running has never been an exciting sport for me and I never thought I'd run a marathon. My mindset around running has certainly shifted over the last few months simply because of the circle of friends that have motivated and inspired me to run with them. I still haven't set my own goals for running and have just been winging it.

At the beginning of the year I decided to enter the Pirates half marathon which was a rash decision in the moment but I knew that it would motivate me to prepare for it and therefore enhance my lifestyle to a certain degree.

There is a lot of transformative power in committing to something in the future. Just like entering into a marathon or Comrades has transformed your lifestyles and training regimes, I believe adding bets to these commitments makes them even more transformative.

If Albie were to have put money on the line to complete Comrades he most likely wouldn't have pulled out by now.

By placing these bets in commitment contracts you also gamify the process of improving your health and becoming part of a healthy community of people who value fitness. These circles of people are often the most successful → Healthy Body = Healthy Mind

---

Slide 3: Solution

- **How Sweat Bet Solves the Problem**:
  - By allowing users to make financial bets on meeting their fitness goals, enhancing motivation through potential financial rewards or losses.
  - The app leverages community and social dynamics to increase accountability.
  - Provides a fun, competitive edge to exercising.

Slide 4: Product/Service Description

- **Functionality**:
  - Users set fitness goals, bet money, and track progress through the app.
  - Integration with Strava to verify achievements. (Similar to how Garmin Connect interfaces with Strava, the Sweat Bet app will plugin to Strava to verify completion of the bets being set)
  - Real-time settlement or penalties based on goals set

- **Why Now**:
  - Increasing awareness of health and wellness makes this the perfect time to introduce a fitness motivation tool.
  - Growing popularity of gamified health apps shows a ready market.

Slide 5: Business Model

- **Revenue Streams**:
  - Transaction fees from each bet.
  - Premium subscriptions for additional features and analytics.
- **Cost Structure**:
  - Development and maintenance of the app.

- Marketing and user acquisition costs.

Slide 6: Traction

- **Metrics**:
  - Number of active users.
  - Monthly Recurring Revenue (if applicable).
  - User engagement and retention rates.

Slide 7: Market Size

- **Total Addressable Market (TAM)**:
  - Potential global revenue from online fitness apps and betting platforms.
- **Serviceable Addressable Market (SAM)**:
  - Focus on active, health-conscious smartphone users in key markets.

There are 1 million registered Park Runners.

https://www.discovery.co.za/corporate/exercise-parkrun-one-million

- **Differentiation**:
  - Direct and automatic settlement of bets placed using the Strava API, Enhanced social features, stronger community engagement, and a more user-friendly betting system.

Slide 9: Financial Highlights

- **Projections for the next 3-5 years**:
  - Expected growth in user base and revenue.

- Key financial metrics like Gross Profit, EBITDA, and Net Profit.

Slide 10: Team

- **Core Team**:
  - Backgrounds, qualifications, and relevant experiences of key team members.
  - Previous successes and roles in similar ventures.

Slide 11: The Ask

- **Capital Needs**:
  - Amount of funding sought.
  - How the funds will be used to scale the business.
  - Expected outcomes and return on investment for investors.

▼ Prompt for Pitch Deck

Hey [Partner's Name],

I've been brainstorming an exciting new project that I think could be a game-changer for us and I can't wait to get your thoughts on it! Picture this: a blockchain-based app that leverages the Strava API to create a unique community for runners where they can actually bet on their running goals.

Here's the core idea: users place bets on how many kilometers they'll run, with all bets secured via smart contracts on the blockchain. The cool part? Strava tracks their progress and once the run is completed, our app automatically verifies the results. If someone doesn't meet their goal, the escrowed funds are transferred to the other party who bet against them.

Imagine the potential to boost motivation and engagement within the running community. It turns every run into a mini-competition, not just with yourself but with others cheering you on or challenging you. We could really tap into the competitive spirit, making fitness more fun and accountable.

Plus, integrating blockchain ensures that all bets are secure and transparent, with no middleman. This could really appeal to tech-savvy runners and those who love a bit of friendly competition.

What do you think? Could this be our next big venture? Let's chat soon and dive deeper into this!

Feel free to personalize it more with any additional thoughts or inside jokes that could make your partner even more interested!

Creating a business plan for a blockchain-based application that integrates with the Strava API to incentivize running through betting involves outlining several key components. Here's a structured approach to developing this business plan:

Executive Summary

- **Business Name**: RunBet Blockchain

- **Mission Statement**: To enhance the running community's engagement by integrating technology with fitness motivation through secure betting.
- **Vision Statement**: To become the leading platform for fitness accountability and community building by leveraging blockchain and API technology.

Business Description

- **Industry**: Fitness Technology / Blockchain
- **Services Offered**: A blockchain-based application that allows users to bet on running goals using smart contracts which verify completion via Strava API data.

Market Analysis

- **Target Market**: Runners, fitness enthusiasts, and casual athletes looking for motivation and community engagement.
- **Market Need**: Many people struggle with motivation in fitness; a betting mechanism introduces an exciting, competitive edge.
- **Competitor Analysis**: Review other fitness betting platforms and blockchain applications. Identify gaps in current offerings that RunBet can fill.

Product Description

- **Functionality**:
  - Users create bets on running goals.
  - Funds are held in a blockchain-based escrow (smart contract).
  - Strava API integration verifies completion of set goals.
  - Smart contracts execute payments based on the outcomes automatically.

Technology Stack

- **Blockchain Platform**: Ethereum for smart contracts and escrow services.
- **APIs**: Strava API for tracking and verifying running metrics.
- **Frontend**: React for a responsive web application.
- **Backend**: Node.js with Express for server-side logic.

Marketing and Sales Strategy

- **Marketing Channels**:
  - Social media campaigns targeting fitness enthusiasts.
  - Partnerships with running clubs and fitness influencers.
  - Sponsorship at athletic events.
- **Sales Strategy**: Freemium model with premium features for enhanced betting capabilities and analytics.

Operational Plan

- **Development Phases**:
  1. Concept Validation: Test basic idea with potential users.
  2. MVP Development: Develop minimal viable product with key features.
  3. Pilot Testing: Launch beta version to gather user feedback.
  4. Full Scale Launch: After refining based on pilot, launch fully.
- **Milestones**:
  - MVP by Q3 2024
  - Pilot by Q4 2024
  - Full Launch by Q2 2025

Financial Plan

- **Budget**:

    - Development Costs: Estimated based on developer hours and technology stack.
    - Marketing Costs: Initial and ongoing marketing expenses.
- **Revenue Streams**:
    - Transaction fees from bets.
    - Subscription fees for premium features.

Legal and Regulatory Considerations

- **Compliance**:
    - Ensure adherence to local and international gambling laws.
    - Data privacy compliance, especially regarding user activity data from Strava.

Risk Management

- **Technological Risks**: Dependence on the Strava API and blockchain stability.
- **Market Risks**: User adoption and engagement.
- **Legal Risks**: Compliance with gambling and financial regulations.

This business plan outlines a clear path from concept through to launch, detailing the technical integration with Strava, the use of blockchain for secure transactions, and strategies for market penetration and growth.

▼ Prompt for Initial Development of SweatBet

You are my professional software engineer who is required to generate all code and provide me with guidance on the creation of a new application I am developing called SweatBet.

The SweatBet app is a platform that is designed to allow running and cycling enthusiasts and wannabes to place bets on themselves and bets as a group to incentivise and motivate them to commit to their fitness goals.

The process flow of the application is as follows:

- Users go on to the app and commence the registration process which entails logging in with email, Google, Apple.
- Once an account has been created the user must then enter their credit card details and connect their Strava account via the Strava API
- The user must then place a bet which takes the following parameters into account (Title of bet, Wager amount for thebet, Person who is required to fulfill the bet which can either be the individual or the friend of the user that is challanged to exercise, the length of the run or cycle, an oiptioanl field for including a time for the bet as well as a date by which the bet needs to be completed)
- Once the bet is locked in, the user should get a notification that the bet has been locked in whether that be the individual or the indivudals friend. In the case of a friend being notified they should have to go to the site and acknowledge the bet.
- The app should then check for the activities of the user included in the bet on the date specified in the bet at 11:59pm to confirm whether the strava activity adhered to the requirements of the bet (If they did then no money is taken from the users account but if there is no activity that adheres to the bet requirements then the money should be taken from the bettors account

Please can we walk through the process of creating a web-based application that achieves the above - to start off we can ignore the payment mechanism but focus on the registration, bet placing and Strava API integration

SweatBet Financial Model Research

▼ Key questions:

- What is the game instructions version of the message?
- Are people willing to place bets?
- Do we take the money first or take the money later?

▼ Company registration
